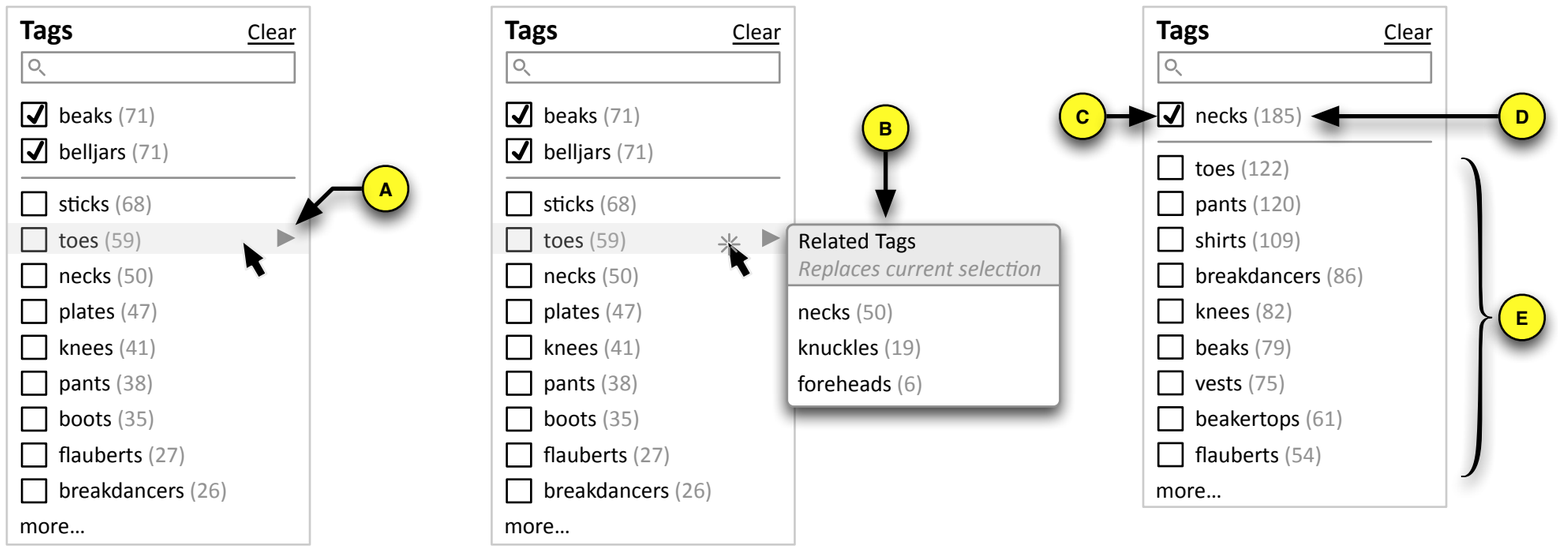
Filter Results/Tag Selection (Related Tags)



Notes:

- If a tag is related to any other tags in the currently displayed Question list, it will reveal a "related tags" indicator on rollover (A).
  - This applies to both selected and unselected tags.
  - Click anywhere on the tag (other than the checkbox) to show a "Related Tags" menu (B).
    - The Related Tags counts should reflect their occurrence in the currently displayed Question list. (Or maybe not; see **Questions**, below.)
  - Click a related tag to select only that tag (C), clearing all other tags. As when any other tag filter change is made:
    - The Question list is updated accordingly.
    - The count for the just-selected tag (D) should reflect the updated Question list.
    - n of the remaining most commonly used tags should be shown (E), reflecting the updated Question list.
    - Search Box contents should be preserved.

Questions:

- Related Tag counts should show post-search/pre-filter counts, i.e. NOT based on currently displayed list (which is post-filter).
  - Actually, maybe they should still take other filters into account (i.e. date and binary property filters). In other words, the tag's shadow. *The count should reflect the result count you'd get if you selected that tag.*
- Alternately, consider not showing counts in related tags.
