

Search Box

- Notes:**
- With no search string entered (A), the user is in Browse mode (B).
  - All Questions are shown, subject to the Filter settings (C).
  - Default sort order is 'newest', i.e. by time, most recent first (D).
  - To search Questions, first enter a search string into the Search Box (E), then type ENTER or click Search (F).
  - Result of the search is indicated (G) and shown, subject to the Filter settings.
  - All QnA Doc content is searched, including comments.
  - For each search, the results should initially be displayed in relevance order (H).
  - A clear button is shown (I) when a search string is entered. Click it to clear the search field (and return to Browse mode, with default sort order).
  - The result heading (B,G) should indicate if any filters are applied:
    - In Browse mode:  
Browsing <nnn> Questions (filtered)
    - In Search mode:  
Search Results (filtered): <nnn> Questions
  - User may include manual constraints in the search string (e.g. 'user:Hanksy97'), based on an application-specific grammar (TBD).
  - Constraints used in the search string that are also available as Filter facets (in the sidebar) may affect the search results, but would not have any effect on the filter settings.
  - The user can click the Search Tips button (J) to toggle a panel (K) that documents that grammar.
    - The rest of the page content should be adjusted accordingly (L).
  - The Search Tips panel should be automatically closed when the search field is cleared.
  - Search box should be included on the QnA Page, but cleared on initial visit to that page (i.e. when clicking on a Question from the Question List).
